SUMMARY

QA & Automations Team Lead with 4+ years designing and implementing **automated testing frameworks** and QA processes across **Web, API, Mobile, Desktop, Web3, and Blockchain**. Ran **AI-assisted testing in production** and transformed a traditional SDLC into an **agentic one** — integrated AI agents across test generation, automation scripting, triage, and observability, and built the guardrails that keep their outputs consistent and auditable. Cut release sign-off from **days to hours**, shipped **300+ E2E tests** covering 85% of critical flows, saved **100+ manual hours per week**, and published open-source agentic QA tooling to PyPI. Learned first-hand where AI multiplies quality work and where it breaks down.

QUALITY ENGINEERING IN THE AI ERA

AI-Ready Test Architecture Designed frameworks with structured outputs and deterministic assertions that AI agents generate, run, and interpret without manual intervention.	Agent Guardrails & Consistency Built guardrails enforcing reliability and repeatability for AI-generated test actions — kept hallucinations out of production.
Testing AI Systems (LLM QA) Implemented distribution-based assertions across prompt variants, probed guardrails with adversarial inputs, and built eval regression harnesses (LangChain, Chroma) re-scored on every model or prompt change.	MCP & Agentic Tooling Created and published Tuskr MCP to PyPI, giving Cursor and AI agents direct access to test case management. Adopted a daily AI-augmented workflow with Claude Code, Cursor, and LLM tooling.

EXPERIENCE

QA & Automations Team Lead · DcentraLab Web3 / blockchain startup	May 2024 – Jun 2026
- Owned the full test strategy: designed and implemented automated testing frameworks from zero (Selenium/Python, GitLab CI/CD) and led a Selenium-to-Playwright migration that cut per-test wallet setup from minutes to seconds via pre-injected wallets. Developed and improved QA processes end to end: established testing standards and best practices and created detailed test plans and test cases for every feature and release. - Shipped 300+ E2E blockchain and Web3 tests covering wallet flows, smart contract interactions, and on-chain state verification — 85% of critical user flows, 100+ manual hours saved weekly. - Cut release sign-off time from days to hours; architected a parameterized CI pipeline serving multiple products with parallel execution across environments. - Transformed the SDLC into an agentic pipeline: AI agents across test case generation, automation scripting, triage, and observability — with execution standards and guardrails for consistent, auditable outputs. - Built MCP integration for AI agents to interact with test case management; developed test strategies for LLM-integrated features, including output validation and edge-case coverage. - Delivered load and performance testing (JMeter, Locust), mobile automation (Appium), and accessibility compliance checks; wired production monitoring to real-time Slack alerting. - Caught a decimal-precision bug in cross-chain token transfers via computed assertions — a silent financial error on every transaction that manual testing would have missed; release held, fix shipped. - Mentored 5 QA engineers; served as the bridge between QA, dev, product, and management, and delivered AI-powered automation services across support, HR, and sales teams.	
QA Automation Engineer · Unleash Feature management SaaS · acquired by Zendesk	Jun 2023 – Feb 2024
- Inherited a 500+ test suite in full failure; diagnosed root causes and restored CI pass rate from 0% to 94% in 3 weeks. - Created detailed test plans and 100+ integration and E2E test cases from scratch (Cypress/TypeScript); migrated reporting to Qase.io and wired the full pipeline through Azure Pipelines. - Validated feature-flag rollouts and A/B experiments across the full release lifecycle on the platform powering these workflows for enterprise teams.	
QA Automation Engineer · Cymbio E-commerce automation platform · acquired by PayPal	Jan 2022 – May 2023
- Built the company's first automated test suite from zero (Cypress/TypeScript); grew coverage to 150+ tests across critical e-commerce and integration flows. - Set up GitHub Actions CI on every pull request, holding a 95%+ pass rate; 2,500+ contributions over 16 months. The suite ran untouched in production for 12+ months after handoff.	

QA automation bootcamps

- Designed and delivered QA automation curriculum to **30+ engineers** across three programs: Selenium with TestNG (Java) and Pytest (Python), CI/CD, framework design, and real-world best practices.

QA LEADERSHIP & APPROACH

- **Shifted quality left** — ran requirement gap analysis, risk identification, and authored detailed test plans and scenario maps before development began; achieved zero bugs slipping to production undetected.
- **Drove risk-based release decisions** — weighed severity, real user volume, and reproducibility on every blocking call, and documented each accepted risk with PM sign-off, keeping “we decided not to block” and “we didn’t know” two different conversations.
- **Architected coverage around risk** — mapped suites to risk dimensions (semantic boundaries, gate interactions, encoding edge cases) so gaps surfaced before the audit, not after.
- **Shipped tests the same day as features** — accelerated scripting with AI; tested AI-driven features against behavioral boundaries, consistency within tolerance, and failure modes rather than exact output assertions.

OPEN SOURCE & SELECTED PROJECTS

- **Tuskr MCP** — github.com/Zapkid/tuskr-mcp
Built a Python MCP server that gives Cursor and AI agents direct access to Tuskr test management — read, search, and validate test cases from the IDE. Deployed for production agentic QA at DcentraLab and published to PyPI.
- **eBay Playwright Suite** — github.com/Zapkid/ebay-playwright-python
Built a Playwright + Python + pytest E2E suite against live ebay.com: implemented data-driven search/cart/pagination flows, session-replay auth, environment profiles, parallel execution (pytest-xdist), Allure reporting, and GitHub Actions CI.
- **Notch Automation Audit** — github.com/Zapkid/Notch-Automation-Audit
Designed and executed a Playwright + Pytest audit of an AI email triage system — authored 70 test cases across 14 suites covering sender, subject, body, and AI-reply gates. Applied QA directly to an AI-driven product.
- **QA Automation Showcase** — github.com/Zapkid/QA-Automation-Testing-Showcase
Developed multi-platform automation infrastructure (Selenium + TestNG, Java) covering Web, API, Mobile, Desktop, and Electron, with Page Object Model architecture and Allure reporting.

SKILLS

Test Automation: Playwright, Selenium, Cypress, Pytest, TestNG, Appium, Postman, REST-assured, Applitools, Allure

AI / LLM: Claude Code, Cursor, OpenAI, MCP SDK, LangChain, Chroma (RAG), Ollama, eval harnesses, agent guardrails

Languages: Python, TypeScript, JavaScript, Java, SQL, C#

CI/CD & Infra: GitLab CI, GitHub Actions, Azure Pipelines, Jenkins, Docker, Linux

Performance & Monitoring: JMeter, Locust, k6, Grafana, Datadog, Logz.io, Slack alerting

Security & Accessibility: OWASP ZAP, permission-boundary testing, axe DevTools, Lighthouse

Data & APIs: PostgreSQL, MySQL, MongoDB, Redis, GraphQL, gRPC, WebSockets, REST

Test Management: Qase.io, Tuskr.io, TestRail, Jira, Linear, ClickUp

EDUCATION & CERTIFICATIONS

Quality Assurance Test Automation — ATID Automation College, 2021 · Selenium, Appium, TestNG, Page Objects, REST-assured, DB testing, CI/CD with Jenkins

Blockchain Expert — BDCC (accredited by Israel's Information Technologies Chamber), starting Jun 2026

LinkedIn Learning — earned 16 certificates across testing, Python, JavaScript, SQL, and data analytics
